PREFILED REBUTTAL TESTIMONY OF

ARNOLD GUNDERSEN

ON BEHALF OF PETITIONERS RIVERKEEPER, INC., SCENIC HUDSON, INC., AND NATURAL RESOURCES DEFENSE COUNCIL, INC.

TO THE DIRECT TESTIMONY OF MATTHEW J. BARVENIK (SENIOR PRINCIPAL GZA GEOENVIRONMENTAL, INC.)

REGARDING RADIOLOGICAL MATERIALS

PREFILED REBUTTAL TESTIMONY OF ARNOLD GUNDERSEN ON BEHALF 1 2 **OF PETITIONERS RIVERKEEPER, INC., SCENIC HUDSON, INC., AND** 3 NATURAL RESOURCES DEFENSE COUNCIL, INC. TO THE DIRECT 4 **TESTIMONY OF MATTHEW J. BARVENIK (SENIOR PRINCIPAL GZA** 5 **GEOENVIRONMENTAL, INC.) REGARDING RADIOLOGICAL MATERIALS** 6 7 **INTRODUCTION** 8 9 Q. Mr. Gundersen, please state the purpose of your rebuttal testimony. 10 My testimony addresses key aspects of the prefiled direct testimony presented by Entergy A. 11 witness Matthew J. Barvenik relating to the "Radiological Materials" issue being 12 adjudicated in the above-captioned proceeding (hereinafter "Barvenik Prefiled Direct"). 13 In particular, my testimony responds to Mr. Barvenik's position with regard to (1) causes 14 and sources of radiological leaks and discharges at the Indian Point nuclear power plant 15 ("Indian Point"), (2) the extent and current status of radiological contamination at Indian 16 Point, (3) the impact of such releases on groundwater and the Hudson River, and (4) 17 Entergy's ability to detect and respond to likely future leaks at Indian Point. 18 19 Have you reviewed Mr. Barvenik's testimony? Q. 20 Yes. A. 21 22 Have you reviewed anything else in preparation of this rebuttal testimony? Q. Yes. In addition to the many documents I previously reviewed as listed in my prefiled 23 A. 24 direct testimony (cited herein as "Gundersen Prefiled Direct"), and the New York State 25 Department of Environmental Conservation's ("NYSDEC") Notice of Denial of 26 Entergy's application for a Water Quality Certification, I have reviewed the exhibits to 27 Mr. Barvenik's testimony as well as the most recent quarterly groundwater monitoring 28 report, groundwater monitoring data, and data review checklists provided by Entergy. I 29 have also reviewed Entergy and U.S. Nuclear Regulatory Commission ("NRC") 30 documents relating to safety evaluations and aging management programs at Indian 31 Point. 32

1	Q.	Based upon your review, have you reached an opinion about Mr. Barvenik's
2		testimony?
3	Ά.	Yes, I have. In particular I conclude that:
4		(1) Mr. Barvenik fails to address all the causes and pathways of past, ongoing, and
5		current radiological leaks at Indian Point;
6		(2) Mr. Barvenik inaccurately attempts to minimize the severity of the existing
7		radiological contamination at Indian Point and ignores that fact that the contamination
8		currently exceeds the U.S. Environmental Protection Agency's ("EPA") Maximum
9		Contaminant Levels ("MCLs"), and will likely continue to do so in the future;
10		(3) Mr. Barvenik's testimony mischaracterizes and downplays the impact of radiological
11		leaks and discharges to the Hudson River and is largely irrelevant since the point is
12		that Indian Point is currently and will continue for decades to release radiological
13		materials to the river; and that
14		(4) Mr. Barvenik fails to show that Entergy has the ability to sufficiently detect and
15		respond to likely future leaks. Mr. Barvenik suggests that allowing radioactive
16		material to leak into the groundwater and then be detected by monitoring wells as it
17		"flushes" into the Hudson River is the appropriate method to address contamination at
18		Indian Point. However, Mr. Barvenik failed to examine and address more proactive
19		remediation efforts (such as extraction, which Entergy is pursuing at other sites and
20		which has been previously recommended specifically for Indian Point) that could
21		easily be applied at Indian Point and that would significantly reduce the plant's
22		contamination of the groundwater and the Hudson River.
23		
24	<u>SOUI</u>	RCES OF RADIOLOGICAL LEAKS AND DISCHARGES AT INDIAN POINT
25		
26	Q.	What does Mr. Barvenik describe as the cause(s) of groundwater contamination at
27		Indian Point?
28	A.	Mr. Barvenik suggests that the radiological contamination found at the Indian Point site
29		predominantly originated many years ago from leaks in the Spent Fuel Pools ("SFP")

1		associated with Units 1 and 2. ¹
2		
3	Q.	How does Mr. Barvenik describe the current status of the leaking spent fuel pools?
4	А.	Mr. Barvenik correctly states that the sources of the Unit 1 spent fuel pool leaks are no
5		longer active, as the problematic pool has been drained. ² Mr. Barvenik also states that
6		several leaks identified in the Unit 2 pool were successfully repaired. ³ In particular, Mr.
7		Barvenik concludes that, "[a]s of December 2007, Entergy had repaired all then-
8		identified imperfections in the IP2 SFP." ⁴
9		
10	Q.	Have all leaks in the Unit 2 SFP been identified and repaired?
11	А.	No, Entergy has not yet proven that active leaks from the Unit 2 SFP have ceased. In
12		particular, it is impossible for Entergy to conclude that all leaks have been identified,
13		because Entergy has never been able to inspect nearly half of the spent fuel pool liner. ⁵
14		As explained in the NRC's 2009 Safety Evaluation Report ("SER") relating to the
15		proposed relicensing of Indian Point, "[t]he licensee stated that it completed, in 2007, a
16		one-time inspection of the accessible 40 percent of the SFP liner above the fuel racks."
17		Entergy, as well as GZA, GeoEnvironmental, Inc., have flatly admitted that "active leaks
18		cannot be completely ruled out." ⁷
19		
20		Moreover, while Mr. Barvenik claims that the leaks in the Unit 2 SFP that were identified

³ Barvenik Prefiled Direct at 8:3-17, 19-21.

⁴ Barvenik Prefiled Direct at 8:15-17.

⁵ See generally Gundersen Prefiled Direct at 15-16.

⁶ NRC Safety Evaluation Report Related to the License Renewal of Indian Point Nuclear Generating Unit Nos. 2 and 3 (NUREG-1930) (November 2009), relevant excerpt attached to this rebuttal testimony as **Exhibit-AG-Rad-33**, at page 3-134.

⁷ See Exhibit AG-Rad-9 at page 2; Exhibit-AG-Rad-18 at p.1-3, footnote 6 (GZA GeoEnvironmental, Inc. stating in its quarterly monitoring report for the second quarter of 2010, the most recent quarterly report that Entergy has provided, that "analyses cannot definitively and completely rule out the possibility of a remaining small leak which could then also be supplying Tritium to the groundwater . . .").

1		in 2005 and 2007, and that he misnames "imperfections," were eliminated, ⁸ Mr. Barvenik
2		then testifies that a new leak of the Unit 2 SFP was identified recently in 2010, stating:
3 4 5 6 7 8		Beginning in the third quarter of 2010, we noticed increased tritium levels in a monitoring location adjacent to the IP2 SFP [T]he increased flow appears to be attributable to a leak path from light boxes near the top of the SFP, allowing water to get behind the stainless steel liner plates on the face of the SFP. ⁹
9		It is unlikely that this newly identified leak suddenly emerged in 2010, rather, it most
10		likely existed undetected for many years. Mr. Barvenik states that since its discovery,
11		only a temporary repair to this leak path has been applied. ¹⁰ Mr. Barvenik acknowledges
12		the unresolved nature of this new leak, stating that "additional evaluations continue, so as
13		to fully understand this issue." ¹¹
14		
15		Mr. Barvenik's testimony shows that, despite Entergy's claim of extensive investigations
16		and inspections, leaks from the Unit 2 SFP have not been eliminated because the sources
17		have not yet been adequately identified or remediated.
18		
19	Q.	Are leaks from the Unit 2 SFP likely to continue to occur in the future?
20	A.	Yes. The fact that new leaks were identified as recently as 2010, more than three years
21		after all leaks were reportedly repaired and an alleged thorough examination of the Unit 2
22		SFP was conducted, speaks to the lack of rigor that Entergy has applied to the inspections
23		of the Indian Point Unit 2 SFP.
24		
25		Entergy was unable to identify the source of this new leak by either its inspection of the
26		Indian Point site or its ongoing specific aging management and monitoring techniques
27		currently applied to the Unit 2 SFP. The area where the 2010 leak occurred, unlike other
28		portions of the SFP, was easily accessible during the 2007 inspection and it is likely that
29		this newly identified leak existed undetected for many years. Additionally, the Unit 2

⁸ Barvenik Prefiled Direct at 8:3-17, 18-19.

⁹ Barvenik Prefiled Direct at 11:3-9.

¹⁰ Barvenik Prefiled Direct at 11:9-10.

¹¹ Barvenik Prefiled Direct at 11:12-13.

1	SFP leak-collection box installed in 2007 failed in 2010 to meet its intended design
2	function to collect any radioactive leaks and prevent such contamination from entering
3	the groundwater.
4	
5	The ongoing leaks call into question the thoroughness of the initial inspection in 2005 by
6	Entergy's team and alert us to Entergy's ongoing failure to adequately address the serious
7	aging management issues confronting the Unit 2 SFP, as well as the Indian Point site
8	generally. ¹² These circumstances make future undetected leaks from the already
9	degraded Unit 2 SFP very likely.
10	
11	As a matter of fact, Mr. Barvenik's analysis of the 2010 leak substantiates Riverkeeper's
12	previous statement that "Entergy has no preventative measures in place to be able to
13	detect future leaks from the Unit 2 pool during the proposed relicensing term." ¹³ Instead,
14	Mr. Barvenik's testimony makes it very clear that instead of enhanced inspections of a
15	problematic plant component, Entergy will only rely upon its groundwater monitoring
16	program to detect any problems with the Unit 2 SFP. ¹⁴
17	
18	In fact, as early as 2009, the NRC approved (with a very narrow implication) Entergy's
19	plan to simply monitor radionuclide levels in the groundwater as the method to detect any
20	degraded condition of the pools:
21	Entergy made no commitment for augmented inspection during the
22	extended period of operation Due to the lack of a leak-chase
23	channel system at IP2 to monitor, detect and quantify potential
24	leakage through the SFP liner, the staff is concerned that there has
25	been insufficient time following the corrective actions to be certain
20	that the leakage problems have been permanently corrected
27	I ne licensee stated that it completed, in 2007, a one-time
28	inspection of the accessible 40 percent of the SFP liner To

1 2 3 4 5 6 7 8 9 10 11 12		 provide additional indication of potential spent fuel pool leakage, the applicant has committed to test the groundwater outside the IP2 spent fuel pool for the presence of tritium every 3 months Tritium in the groundwater would indicate leakage from the spent fuel pool, which may lead to degradation Based on applicant's additional commitment to monitor the groundwater there is reasonable assurance that any degradation of the IP2 spent fuel pool would be identified.¹⁵ Entergy's approach will only discover leaks <i>after</i> they occur. This was precisely how the 2010 Unit 2 SFP leak path was discovered.
13		Given the already degraded condition of the Unit 2 SFP, currently ongoing leaks, and
14		Entergy's remarkably insufficient preventative measures, it is my opinion that leaks from
15		the Unit 2 SFP are likely to continue.

¹⁵ Exhibit AG-Rad-33 at pages 3-134, 3-139.

¹⁶ Exhibit AG-Rad-33 at 3-139.

1	Q.	Does Mr. Barvenik describe other causes of groundwater contamination at Indian
2		Point?
3	A.	Though he briefly discusses two additional leaks (a 2009 Unit 1 tank leak and a 2009
4		Refueling Water Storage Tank leak ¹⁷), Mr. Barvenik does not sufficiently discuss all
5		other causes of groundwater contamination at the plant, and instead largely focuses on the
6		leaks from the Indian Point Unit 1 and Unit 2 SFPs that occurred prior to 2007. ¹⁸
7		
8	Q.	Please describe whether there have been or are currently other sources of
9		radiological leaks to groundwater at Indian Point that Mr. Barvenik has failed to
10		discuss.
11	А.	A review of Entergy's own data and documents shows that there have been numerous
12		onsite leaks from pipes and other structures that have resulted in radiological
13		contamination of the Indian Point site other than those identified by Mr. Barvenik. I
14		discussed other numerous leaks in my prefiled direct testimony. ¹⁹
15		
16	Q.	Does Mr. Barvenik identify other pathways by which radioactive leaks have further
17		contaminated the Hudson River?
18	Α.	No, Mr. Barvenik's narrow discussion focuses entirely on radioactive leaks to
19		groundwater and completely ignores radioactive surface water runoff that enters directly
20		into the Hudson River. Mr. Barvenik completely failed to review or address those
21		additional occasions when radioactive material ran across roadways onsite and entered
22		the Hudson River as surface contamination. I have addressed this surface water runoff
23		into the Hudson River in my prefiled direct testimony. ²⁰ In his testimony, Mr. Barvenik
24		has simply neglected to address the "rainout" of radioactive material onto the site and
25		into the Hudson River. In fact, Entergy's "Groundwater Monitoring Program Quarterly
26		Integrated Review Checklist" for the fourth quarter of 2010 as well as the same report for
27		the first quarter of 2011, both state that elevated levels of tritium were again detected in

¹⁷ Barvenik Prefiled Direct at 10:14-15; 10:20-21.

¹⁸ Barvenik Prefiled Direct at 2:9-10; 5:22-23; 6:1, 6-7.

¹⁹ See Gundersen Prefiled Direct at 10-12.

²⁰ See Gundersen Prefiled Direct at 11-12.

storm drains onsite; this is indicative of ongoing rainout, and/or leaks elsewhere onsite 1 that have yet to be identified and addressed.²¹ Copies of these two more recently 2 disclosed checklists that I reviewed are attached to this rebuttal testimony as Exhibit 3 4 AG-Rad-34.

5

Additionally, Mr. Barvenik also fails to acknowledge or discuss Entergy's regularly 6 planned discharges of radioactive liquid effluent into the Hudson River.²² Interestingly, 7 8 such releases are not an unavoidable result of standard nuclear power plant operations: 9 for example, the Vermont Yankee nuclear power plant, which is also owned by Entergy, 10 is a zero liquid release plant. This means that the plant does not discharge *any* liquid 11 effluent into the adjacent waterway, the Connecticut River. Instead, such effluent is 12 either treated and put back into the plant, or shipped offsite as waste that must be 13 disposed.

14

15 Q. In addition to ongoing and likely future leaks from the Unit 2 SFP, are other future radiological leaks at Indian Point likely to occur? 16

17 A. Yes, leaks are likely to continue. Mr. Barvenik readily admits that "sporadic releases occur at any large industrial facility.²³ Additionally, the likelihood of future leaks 18 19 occurring at Indian Point is high.

20

21

The nuclear industry's historical record clearly indicates that aging nuclear plants leak more often than new nuclear plants.²⁴ As I discussed in my prefiled direct testimony, in

22

light of Energy's generally reactive approach to leak management and completely 23

24 inadequate aging management, inspection, and maintenance programs, as Indian Point

- 25 Units 2 and 3 age, it is almost certain that there will be ongoing additional and significant
- radioactive groundwater and surface water leakage and contamination.²⁵ The recently 26

²¹ See Exhibit Gundersen Prefiled Direct at 11; Exhibit-AG-Rad-16.

²² See Gundersen Prefiled Direct at 12; Exhibit AG-Rad-17.

²³ Barvenik Prefiled Direct at 11:20-21.

²⁴ See Gundersen Prefiled Direct at 7, 17.

²⁵ See Gundersen Prefiled Direct at 18-21.

discovered 2010 Unit 2 SFP leak is further evidence of this. As I discussed in my
 prefiled direct testimony, two bodies of experts have determined that Entergy has not
 applied adequate funds to the necessary maintenance of its aging nuclear power plants,²⁶
 thereby creating the conditions for ongoing and future radioactive leaks.

5

6 Additionally, I have reviewed a recent document generated by the NRC that articulates 7 certain additional commitments related to the inspection of buried pipe and tank 8 components at Indian Point beyond those indicated in the documents I reviewed in 9 preparation of my direct testimony. The relevant excerpt of this NRC document is 10 attached to this rebuttal testimony as Exhibit AG-Rad-35. According to this report, the NRC finds this program and Entergy's commitment to perform certain additional 11 12 inspections of buried pipes and tanks acceptable to assure the safety function of its 13 systems during and after accidents. However, it remains my opinion that, even as 14 modified, Entergy's plans are not sufficient to identify and stop all potential radiological leaks from buried components. In fact, this program is not designed or intended to 15 16 prevent any radiological leaks, since the NRC is only concerned with maintaining safety 17 functions of the relevant plant components. As buried components have already been 18 problematic sources of ongoing leaks at Indian Point, and only a limited number of 19 components will be inspected using inferior inspection methods, future leaks from such 20 components are very likely.

21

22 THE EXTENT AND CURRENT STATUS OF THE RADIOLOGICAL

23 CONTAMINATION

24

Q. How does Mr. Barvenik describe the extent of the radiological groundwater contamination at Indian Point?

A. Mr. Barvenik describes the contamination in the groundwater as being at "low levels."²⁷
 28

²⁶ See Gundersen Prefiled Direct at 20-21.

²⁷ Barvenik Prefiled Direct at 19:7.

Q. Do you agree with Mr. Barvenik's characterization of the radiological contamination at Indian Point?

3 No. In my opinion, Mr. Barvenik continues Entergy's attempt to minimize the A. 4 significance of the severity of the radioactive contamination at Indian Point. Due to the size of the plumes, the varied range of radionuclides present in the groundwater, the 5 dangerous toxicity of various radionuclides in the plumes (including Strontium-90 and 6 Cesium-137), and the persistence of the plumes, I believe that the contamination at Indian 7 8 Point, makes it one of the most contaminated operating nuclear power plant sites in the United States. At the time of my review, I have been unable to find any other operating 9 10 U.S. nuclear power plant that is leaking such extensive amounts of tritium *and* strontium contamination into any major body of water like the Hudson River. The situation at 11 12 Indian Point is clearly not merely the result of "sporadic releases, which occur at any large industrial facility," as Mr. Barvenik implies.²⁸ 13

14

While Mr. Barvenik discusses the contamination in terms of the amount of radionuclides 15 16 reaching the Hudson River and whether such amounts comply with federal regulatory limits for radiological effluent releases.²⁹ he does not speak at all to the level of 17 contamination actually in the groundwater, or address EPA Maximum Contaminant 18 19 Levels ("MCLs"). Since the groundwater contamination at Indian Point was discovered, 20 radionuclides have regularly been detected at high levels, well in excess of EPA MCLs. 21 Riverkeeper's attorneys have advised me that a New York State water quality standard requires that the groundwater beneath Indian Point be acceptable for potable uses.³⁰ My 22 23 review of Entergy's data reveals that the current contamination continues to exceed

²⁸ Barvenik Prefiled Direct at 11:20-21.

²⁹ Barvenik Prefiled Direct at 2:14-15; 7:16-17;16:15; 22:5-6.

³⁰ In particular, Riverkeeper's attorneys advised me that the following New York State laws and regulations are relevant and applicable to radiological material leaks from Indian Point:

- 6 NYCRR § 701.18, which classifies all fresh groundwaters of New York State as "GA fresh groundwaters."
- 6 NYCRR § 701.15, which provides that the best usage of "GA fresh groundwater" is "as a source of potable water supply."
- New York Environmental Conservation Law § 17-0807, which prohibits "(1) the discharge of any radiological, chemical or biological warfare agent or high-level radioactive waste . . ."

1		EPA's MCLs, and therefore, violates the State's standard. The most recent monitoring
2		well sampling data that Entergy has provided, from the second quarter of 2011, is
3		attached to this rebuttal testimony as Exhibit AG-Rad-36. This data shows that Entergy
4		continues to detect excessive levels of contamination in numerous sample locations, as
5		follows: Cesium-137 was detected in monitoring well ("MW")-42 at 21,500 pCi/l, more
6		than 100 times the EPA MCL set at 200 pCi/l; Tritium was detected in MW-30, MW-56,
7		and MW-57 at 113,000 pCi/l, 76,4000 pCi/l, and 20,300 pCi/l, respectively, all in excess
8		of the EPA MCL for tritium set at 20,000 pCi/l; Nickel-63 was detected in MW-42 at 190
9		pCi/l, almost four times the EPA MCL set at 50 pCi/l; and Strontium-90 was detected in
10		eight monitoring wells and an additional sampling location in excess of the EPA MCL for
11		Strontium-90 set at 8 pCi/l: MW-37 (8.72 pCi/l), MW-49 (12.6 pCi/l, 15.7 pCi/l and 16.2
12		pCi/l), MW-50 (9.53 pCi/l and 26.3 pCi/l), MW-53 (35.5 pCi/l), MW-54 (12 pCi/l and 19
13		pCi/l), MW-57 (31.1 pCi/l), MW-66 (10.6 pCi/l), MW-67 (12.5 pCi/l), and at sample
14		location U1-CSS (16.1 pCi/l).
15		
16	Q.	How does Mr. Barvenik describe the current status of the plumes of radiological
17		contamination?
18	А.	Mr. Barvenik states that the plumes of contamination at Indian Point have been
19		decreasing, and will continue to decrease over time. ³¹
20		
21	Q.	Please evaluate Mr. Barvenik's assessment of the current status of the radiological
22		contamination plumes at Indian Point.
23	А.	Mr. Barvenik's assessment is not well-founded. Decades worth of contamination that is
24		now underneath the site will bleed out slowly, and not rapidly, to the Hudson River. As a
25		result, the few years of monitoring that have been completed are not likely to be enough
26		to establish a definitive trend. GZA, GeoEnvironmental, Inc. flatly recognizes that years
27		of monitoring are necessary in order to confirm the status of the plumes. ³² Also, over
28		time, the contamination spreads wider and deeper, causing individual monitoring well

³¹ Barvenik Prefiled Direct at 2:15-19; 6:1-3; 8:19-21; 9:12-16; 16:20-23; 17:1-6.

³² See Exhibit AG-Rad-18 at page 1-3.

1		concentrations to decrease, ³³ which may cast an inaccurate picture of the rate of any
2		overall decline of these radiologically contaminated plumes.
3		
4		In any event, based upon my review of Entergy's quarterly monitoring well sample
5		results to date, it is apparent that quarter to quarter, radionuclide levels in the wells vary
6		upwards and downwards. ³⁴
7		
8	Q.	Does Mr. Barvenik dispute that the radiological contamination at Indian Point will
9		remain in the groundwater?
<mark>10</mark>	<mark>A.</mark>	No, he does not. Mr. Barvenik explicitly states that the radiological contamination will
11		remain onsite at Indian Point until it is "flushed" out into the Hudson River. ³⁵ My nearly
12		40-year experience as a nuclear engineer indicates that the process to completely
13		eliminate any radioactive contamination by simply hoping it will eventually "flush" out
14		into a nearby body of water will take many decades if not an entire century after the
15		shutdown and dismantlement of Indian Point before the site is free of radioactive
16		contamination.
17		
18	Q.	How will ongoing radiological leaks at Indian Point and future radiological leaks
19		that are likely to occur at Indian Point, as you discussed above, affect the
20		radiological plumes that are contaminating Indian Point and the Hudson River?
21	Α.	Mr. Barvenik claims that recently identified leaks at Indian Point have not "resulted in
22		any material increase in the tritium plume." ³⁶ While Mr. Barvenik does not provide any
23		scientific definition or measurable data detailing his usage of the term "material
24		increase," the reality is that newly identified leaks will definitely add to the existing
25		radionuclides in the groundwater. Mr. Barvenik's testimony plainly acknowledges that
26		each newly discovered leak led to spikes in the levels of tritium found in Entergy's

³³ See Gundersen Prefiled Direct at 13.

³⁴ See Exhibit AG-Rad-18; Gundersen Prefiled Direct at 13.

³⁵ Barvenik Prefiled Direct at 9:14-15; *see also* Exhibit AG-Rad-18 at page 1-3 (explaining that Entergy's chosen "remedial" approach is monitored natural attenuation).

³⁶ Barvenik Prefiled Direct at10:18-19; 11:11-13.

1		monitoring well samples. ³⁷ For example, the undetected 2010 Unit 2 SFP leak event
2		further increased groundwater contamination in the vicinity of the Unit 2 SFP as
3		determined by a nearby monitoring well. ³⁸
4		
5		New leaks, including the 2010 Unit SFP leak, and other likely future leaks from aging
6		components at Indian Point, guarantee that the present groundwater contamination will
7		not be abated and, to the contrary, will grow. GZA, GeoEnvironmental Inc.'s most
8		recent quarterly monitoring report acknowledged that radionuclide levels in the
9		groundwater will fluctuate and peak in the future "due to episodic releases to the
10		groundwater. ³⁹ It is, therefore, foreseeable that levels in the groundwater will remain
11		high, and continue to exceed EPA MCLs.
12		
13	RAD	IOLOGICAL RELEASES TO THE HUDSON RIVER
14		
15	Q.	Does Mr. Barvenik dispute the fact that the radiological contamination at Indian
16		Point enters into the Hudson River?
17	A.	No, he does not dispute that fact. As a matter of fact, Mr. Barvenik explicitly
18		acknowledges throughout his testimony that radioactive groundwater contamination does
19		actually "flush" into the Hudson River from the Indian Point site. ⁴⁰ Mr. Barvenik
20		explains that all the radioactive contamination in the groundwater will move west into the
21		Hudson River and none of it will migrate or be washed into any surrounding property
22		located to the north, south or east. ⁴¹
23		
24		Because the contamination at Indian Point will persist, likely grow, and migrate slowly, it
25		will discharge to the Hudson River for decades. This is the result of Entergy's use of

³⁷ Barvenik Prefiled Direct at 10:15-18; 10:20-22; 11:3-4.

³⁸ Barvenik Prefiled Direct at 11:3-4.

³⁹ See Gundersen Prefiled Direct at 13; Exhibit AG-Rad-18 at page 1-3.

⁴⁰ Barvenik Prefiled Direct at 9:15.

⁴¹ Barvenik Prefiled Direct at 2:13-15; 5:14-17; 6:15-18; 20:20-22; 22:3-6.

only Monitored Natural Attenuation to "manage the contamination,"⁴² and the absence of 1 2 any extraction or remediation of the contamination. 3 4 Moreover, while Mr. Barvenik only appears to have discussed groundwater leakage into the Hudson River, the data and documents I reviewed in preparation of my prefiled 5 testimony indicates that direct surface discharges are also a significant source of the 6 radioactive contamination that migrates to the Hudson River.⁴³ 7 8 9 Q. How does Mr. Barvenik characterize and evaluate the releases of radiological 10 contamination to the Hudson River? While acknowledging that Indian Point will continue to "flush" radiation into the Hudson 11 A. 12 River for many decades, Mr. Barvenik has attempted to minimize the impact of this radioactive contamination by comparing this migrating radioactive plume to NRC dose 13 calculations of radiation exposure by consumption of contaminated fish.⁴⁴ As explained 14 in Entergy's annual Radiological Effluent Release Reports ("RERR"), Entergy's "[l]iquid 15 16 offsite dose calculations involve fish and invertebrate consumption pathways only." The 17 relevant excerpt of Entergy's most recent RERR is attached to my rebuttal testimony as Exhibit AG-Rad-37. Mr. Barvenik repeatedly states that amounts of radionuclides 18 going into the river are below NRC's dose-related limits.⁴⁵ 19 20 21 Please describe your opinion of Mr. Barvenik's evaluation of radiological releases to Q. 22 the Hudson River. 23 Mr. Barvenik's evaluation is problematic for several reasons. First, Riverkeeper's A.

⁴² See Gundersen Prefiled Direct at 21-22; Exhibit AG-Rad-18 at page 1-3.

⁴³ See Gundersen Prefiled Direct at 10-12, 14.

⁴⁴ Barvenik Prefiled Direct at 9:5-6; 11:1-2; 11:14-15;

⁴⁵ Barvenik Prefiled Direct at 9:5-6; 11:1-2; 11:14-15. Barvenik lists the amounts of tritium and other radionuclides released to the Hudson River as a result of the contamination at Indian Point in terms of curies per year. Barvenik Prefiled Direct at 7. These values in terms of picocuries, which form the basis for EPA's MCLs are as follows: for tritium: 190 billion pCi in 2006, 64 billion pCi in 2007, 200 billion pCi in 2008, 70 billion pCi in 2009, and 120 billion pCi in 2010; for "other" radionuclides, including strontium and cesium: 570 million pCi in 2006, 80 million pCi in 2007, 160 million pCi in 2008, 250 million pCi in 2009, and 42 million pCi in 2010. These levels are not insignificant.

1	attorneys have advised me that one applicable New York State law (NYS Environmental
2	Conservation Law § 17-0807(1)) prohibits "the discharge of any radiological, chemical or
3	biological warefare agent or high-level radioactive waste." (Therefore, Mr. Barvenik's)
4	analysis and testimony miss the salient point that the Hudson River is currently and will
5	continue for decades to be subjected to radiological releases from the groundwater
6	contamination at Indian Point and from surface water discharges. Mr. Barvenik
7	repeatedly states that the releases to the Hudson River have had "no discernible effect on
8	the level of radionuclides contained in Hudson River water" and that the leaks have not
9	caused a "material increase" in offsite dose analysis. ⁴⁶ While Mr. Barvenik neglects to
10	provide any definitions for his usage of the terms "discernable effect" or "material
11	increase," the bottom line is that such statements do not change the fact that radiological
12	releases are occurring.
13	
14	However, even assuming the State of New York did not have this prohibition (which is
15	not the case), Mr. Barvenik's assessment is still defective. I reviewed NYSDEC's Notice
16	of Denial of Entergy's request for a Water Quality Certification, which states that
17 18 19 20 21 22 23	the discharge of radiological substances (including, but not limited to, radioactive liquid, radioactive solids, radioactive gases, and stormwater) from the Indian Point site into the Hudson River, are "deleterious substances" and could impair the water for their best usage where, as here, primary and secondary contact recreation is concerned. ⁴⁷
24	However, Mr. Barvenik's testimony only discusses the impact of radiological releases to
25	the Hudson River in terms of NRC dose calculations of radiation exposure by
26	consumption of contaminated fish.
27	
28	Mr. Barvenik fails to acknowledge other potential impacts that radioactive releases to the
29	Hudson River may have upon the health of residents in proximity to the Hudson River.

⁴⁶ Barvenik Prefiled Direct at 2:22-23; 10:18-19; 11:11-12; 11:14-15.

⁴⁷ Joint Application for CWA § 401 Water Quality Certification NRC License Renewal – Entergy Nuclear Indian Point Units 2 and 3 DEC Nos.: 3-5522-00011/00030 (IP2) and 3-5522-00105/00031 (IP3), Notice of Denial (April 2, 2010), at 11.

1	The Biological Effects of Ionizing ⁴⁸ Radiation (BEIR) VII Report, issued by the National
2	Academy of Science on June 29, 2005, reaffirmed the conclusion of the prior report that
3	every exposure to radiation, regardless of how small, produces a corresponding increase
4	in the likelihood of cancer. ⁴⁹ Based upon the BEIR VII report by the National Academy
5	of Science, the radioactive releases "flushed" into the Hudson River via ground and
6	surface water from the Indian Point site could increase the incidence of cancer to those
7	exposed through primary and secondary contact activities, such as swimming.
8	
9	Additionally, Mr. Barvenik states that a 2009 NYSDEC report suggests that the
10	Strontium-90 concentrations in fish near Indian Point are no different than Strontium-90
11	concentrations in fish upstream from the plant, and that this "finding[] support[s] the
12	conclusion that there is no effect on [Hudson River] fish from the radionuclide releases to
13	groundwater" at Indian Point. ⁵⁰ And, therefore, according to Mr. Barvenik, radioactive
14	leakage from Indian Point into the Hudson River has no radiological impact upon aquatic
15	species or the public using the river and its water.
16	
17	This report is not conclusive for several reasons. Entergy's own Indian Point monitoring
18	wells have clearly determined that Strontium-90, tritium, and other toxic radionuclides
19	contaminate the Indian Point site and flush directly into the Hudson River. These
20	radionuclides have the potential to impact fish in the river during Entergy's proposed
21	period of extended operation. For example, in January 2007, Entergy shared data with
22	the NRC from the 1970s and 1980s (generated before NRC discontinued the requirement
23	that nuclear licensees test for Strontium-90 in the offsite environment) that showed that
24	both fish and shellfish showed detectable levels of not only Strontium-90, but also of
25	Strontium-89, a shorter lived isotope that is not found in residual background radiation
26	resulting from nuclear weapons testing. A copy of this correspondence is attached to this
27	rebuttal testimony as Exhibit AG-Rad-38. This supports the need for further and

⁴⁸ Ionizing radiation are alpha, beta, gamma, and neutrons that cause cellular damage by ionization, that is the process that breaks atomic bonds and creates negative and positive ions.

⁴⁹ See Exhibit AG-Rad-20.

⁵⁰ Barvenik Prefiled Direct at 18:5-6, 9-11.

1 ongoing assessment of the effect that Strontium-90 and other radionuclides may have on 2 Hudson River biota and nearby Haverstraw Bay. Riverkeeper's attorneys have advised me that Haverstraw Bay is a New York State designated Essential Fish Habitat and 3 4 Significant Coastal Fish and Wildlife Habitat, which is a major nursery and feeding area for many critical fish species in the Hudson River.⁵¹ 5 6 7 NYSDEC's report also fails to note that other possible upstream sources of Strontium-90, 8 especially the Knolls Atomic Power Lab (KAPL), may have affected the NYSDEC's assessment of other non-fallout related sources of Strontium-90. Finally, the NYSDEC 9 2009 study appears to have been a one-time investigation. Strontium contaminates the 10 environment for decades and is a bone seeker that bioaccumulates instead of dissipating; 11 12 it is, therefore, possible that Strontium-90 and/or other radionuclides could impact Hudson River fish in the future. 13 14 15 ENTERGY'S INABILITY TO DETECT AND RESPOND TO POTENTIAL FUTURE 16 **RADIOLOGICAL LEAKS** 17 18 Q. Please describe Mr. Barvenik's explanation regarding how Entergy will detect 19 future radiological leaks at Indian Point. 20 A. Mr. Barvenik's testimony reveals that Entergy intends to exclusively rely upon its 21 existing groundwater monitoring program to detect leaks after they occur, rather than apply proven proactive mitigation techniques that should be implemented as a key 22 23 component to a sound aging management program. Throughout his testimony Mr. 24 Barvenik maintains that Entergy will allow the leaks to occur, identify the leaks when 25 they finally contaminate the groundwater, and only then attempt to find the origin of such leaks somewhere at Indian Point.⁵² 26 27

⁵¹See Coastal Fish & Wildlife Habitat Rating Form, Haverstraw Bay, *available at*, <u>http://nyswaterfronts.com/downloads/pdfs/sig_hab/hudsonriver/Haverstraw_Bay.pdf</u> (last visited Sept. 29, 2011).

⁵² Barvenik Prefiled Direct at 1:20-22; 2:6-7; 3:1-3; 5:8-10; 10:6-10; 13:15-17, 18-21; 14:8-9; 16:10-17; 21:20-23, 22:1-2, 6-8; 23:11-16.

1	Q.	Please evaluate Entergy's approach for detecting future radiological leaks at Indian
2		Point, as described by Mr. Barvenik.
3	А.	Entergy's lax process relies solely upon a groundwater-monitoring plan that has
4		previously taken months to detect leaks, while such leaks continually contaminated the
5		groundwater and ultimately "flushed" into the Hudson River. Reliance on this after-the-
6		fact monitoring program will fail to prevent leaks before they occur.
7		
8		Entergy's plan continues to be the same as it has been in the past, and that is to attempt to
9		repair leaks once the source is ever uncovered. Mr. Barvenik outlines three such
10		incidents where releases to groundwater were discovered well after a leak had occurred.53
11		
12		Throughout his testimony, Mr. Barvenik does not detail any proactive or preventative
13		steps that Entergy would undertake that would protect the Hudson River, aquatic life, and
14		public health and safety. In fact, Entergy has inadequate plans, programs, practices, and
15		commitments for inspecting and maintaining components that are currently faulty, and
16		will most likely leak in the future. Entergy's aging management programs are seemingly
17		incapable of preemptively addressing leaks (as described above and in my prefiled direct
18		testimony ⁵⁴). Therefore, under Entergy's chosen wait-and-see approach, leaks from
19		degraded and aging components at Indian Point will not be prevented from occurring in
20		the future.
21		
22		Mr. Barvenik's testimony confirms that Entergy will continue to employ a completely
23		reactive approach to dealing with radiological leakage issues at Indian Point. I explained
24		this reactive approach in my prefiled direct testimony. ⁵⁵ This cavalier attitude with
25		regards to preventatively detecting future leaks is perfectly exemplified by Mr.
26		Barvenik's discussion of why an investigation into radiological leaks needed to be
27		initiated several years ago, as memorialized in an Entergy document that was attached to

⁵³ Barvenik Prefiled Direct at pp.10-11.

⁵⁴ Gundersen Prefiled Direct at 18-21.

⁵⁵ Gundersen Prefiled Direct at 20.

1 my prefiled direct testimony as **Exhibit AG-Rad-26**. In this document, Mr. Barvenik 2 explained why he had become involved in the leakage issue on behalf of Entergy: "the issue clearly got Bill and Hillary [Clinton]'s attention and they are pissed (they have a 3 4 house in the 10 mile 'your [sic] screwed zone'), were apparently out at the plant 5 yesterday while we were there and threatening Congressional hearings."56 6 Mr. Barvenik repeatedly claims that Entergy can and will "respond rapidly and 7 Q. appropriately to such releases."⁵⁷ Do you believe that assessment to be accurate? 8 9 No. Mr. Barvenik admits that Entergy only learns of the leaks *after-the-fact*, yet A. incongruously he claims that Entergy can respond "quickly."⁵⁸ This is illogical. Relying 10 upon a groundwater-monitoring program that will only detect leaks days, weeks, or even 11 months after they occur, clearly undermines the ability to "respond rapidly" to 12 radiological leaks and contamination. 13 14 15 Additionally, my own direct experience with Entergy's corporate personnel and 16 management and its programs to detect and mitigate leaks indicates that Entergy's 17 assumptions that it will be able to respond rapidly and appropriately to radioactive releases are unfounded and incorrect. In my experience, Entergy's programs have not 18 19 allowed for rapid assessment and/or rapid mitigation intervention. 20 21 Specifically, in my role as a legislative appointee to the State of Vermont's Vermont 22 Yankee Public Oversight Panel, I became involved with Entergy's attempts to identify, 23 quantify and mitigate a series of leaks at the Vermont Yankee (VY) nuclear power plant. 24 While leaks at VY began during the 1980s and increased further in 2007, Entergy was 25 unable to identify any leaks until January 2010, after which it took six more weeks for 26 Entergy to locate the source of the contamination. At that time, it was discovered that 27 Entergy was aware of sinkholes in the ground at the source of the leak for at least 18-

⁵⁶ See Exhibit AG-Rad-26 at page 4.

⁵⁷ See Barvenik Prefiled Direct at 3:1-3; 22:6-8.

⁵⁸ Barvenik Prefiled Direct at 22:6-8.

months prior to the leak's migration in a plume toward the Connecticut River. Instead of investigating the onsite sinkholes, Entergy chose to simply fill in the holes and not pursue the cause of these significant changes to site topography.

5 Once the apparent source was identified, months passed and Entergy was still unable to determine how or why radioactive contamination that included both Cesium-137 and 6 7 Strontium-90, found 17-feet underground and adjacent to the radioactive tritium leak, had 8 contaminated the site's groundwater. In a meeting held on March 31, 2010 with Entergy 9 Vice President John McCann, the State of Vermont, and the Public Oversight Panel, Entergy surmised that Cesium-137 probably originated from bomb testing or Chernobyl 10 11 releases. Given my expertise and study of Cesium-137 and Strontium-90 releases from 12 Boiling Water Reactors (BWR's) for almost a decade, it was evident to me that Cesium-13 137 and Strontium-90 were created by fuel failures that occurred early in the life of the plant; the Cesium-137 and Strontium-90 had built up during VY's 38 years of operation 14 15 and stuck to the walls of the pipes until those pipes cracked and failed. I explained to 16 Entergy that the cesium likely came from inside the broken pipe and had leaked out along 17 with the tritium into the pipe vault, and suggested that Entergy's staff sample inside the pipe, which Entergy agreed to do. The next day, Entergy announced that, indeed, 18 19 Cesium-137 had leaked out with the tritium when the pipe failed, proving my hypothesis was correct. In response to an e-mail thanking him for running the test I had 20 recommended, Mr. McCann responded "My hat's off Arnie. Like I said at our meeting, 21 22 that was a good idea. That should certainly help us understand that it isn't something 23 new anyway. The disconnect between the condensate sample and soil sample was perplexing. This helps clear it up." A copy of this e-mail is appended hereto as Exhibit 24 25 AG-Rad-39.

26

1

2

3

4

While I appreciate Mr. McCann's e-mail, it is perplexing to me that Entergy was unable to discover the location of the contamination without the assistance of an independent expert whom they had not sought out. My experience starkly exemplifies how complacent and slow Entergy has proven to be when it comes to managing radiological leaks at its nuclear plants.

1		
2		The experience at Indian Point has proved to be no different: leaks occur and accrue for
3		years without detection or an "appropriate response," most recently with the Unit 2 SFP
4		(light box-related leak described above.) Notably, this most recent leak was discovered
5		more than three years after all leaks were reportedly repaired and after an alleged
6		thorough examination of the Unit 2 SFP was conducted. And even though this latest leak
7		was discovered almost two years ago in 2010, Entergy has not yet undertaken a
8		permanent repair. As Mr. Barvenik explains, "additional evaluations continue, so as to
9		fully understand this issue."59 By way of another example, increased levels of tritium in
10		storm drains were detected in numerous sampling results in 2009, and Entergy could not
11		definitively determine all potential causes. ⁶⁰ Recent sampling data from 2011 continues
12		to show elevated levels of tritium in onsite storm drains. ⁶¹
13		
14		In my opinion, Entergy has failed to demonstrate that it can "respond rapidly and
15		appropriately" to likely future radiological leaks at Indian Point.
16		
17		Finally, whether Entergy can "respond rapidly and appropriately" to leaks does not
18		change the fact that leaks and resulting releases to New York State waters can and will
19		occur at Indian Point. Additionally, Mr. Barvenik's testimony actually confirms
20		Entergy's tolerance of such leaks, in lieu of leak prevention.
21		
22	Q.	Will the network of monitoring wells Entergy has installed at Indian Point detect all
23		sizes of radioactive leaks?
24	А.	No, the network of wells will not detect all leaks. Mr. Barvenik repeatedly indicates that
25		the monitoring wells will only detect future leaks that are "comparable" to the
26		extraordinarily large leaks that have occurred in the past. In fact, GZA,
27		GeoEnvironmental, Inc. has acknowledged that certain minimum leaks remain

⁵⁹ Barvenik Prefiled Direct at 11:12-13.

⁶⁰ See Gundersen Prefiled Direct at 11; Exhibit AG-Rad-16.

⁶¹ See Exhibit AG-Rad-34.

undetectable by the groundwater monitoring system at Indian Point.⁶² Therefore, 1 2 Entergy's ability to detect smaller, longer lasting leaks apparently is excluded by Mr. Barvenik's testimony. 3 4 5 Mr. Barvenik also references that Entergy has a "remediation" plan concerning the Q. radiological contamination at Indian Point.⁶³ Can you describe Mr. Barvenik's 6 7 explanation of Entergy's plan? 8 A. No, I cannot, From the documentation I have seen and reviewed, Entergy has not 9 revealed any plan for "remediation" of radiological contamination at Indian Point. What 10 Mr. Barvenik incorrectly labels as a plan is simply Entergy's ongoing methodology of "flushing" its radioactively contaminated groundwater into the Hudson River in an 11 12 attempt to dilute the contamination rather than mitigate the contamination by installing 13 extraction wells. <mark>14</mark> Disturbingly, Mr. Barvenik ignores other viable mitigation and remediation options 15 16 available to Entergy rather than simply leaving the growing radiological contamination to reach the Hudson River.⁶⁴ Such mitigation processes would clean the site much faster

17 and more thoroughly than allowing the groundwater to "flush" radiological 18 contamination directly into the Hudson River. In my prefiled direct testimony, I 19 20 discussed the fact that other nuclear power plants owned by Entergy are using extraction 21 wells in order to remove radioactive contamination and prevent it from migrating into the 22 groundwater, the water table, nearby bodies of water, and possibly contaminating precious aquifers.⁶⁵ Entergy already knows that the installation and application of 23 24 extraction wells is a successful remediation technique: the extraction process currently 25 applied by Entergy at some of its other operating nuclear power plant sites physically 26 extracts radioactive water from underground leaks and deposits it into above-ground 27 tanks. This radioactive water is then treated and processed.

⁶² See Exhibit-AG-Rad-18 at page 1-3, footnote 6.

⁶³ Barvenik Prefiled Direct at 4:8; 20:10.

⁶⁴ See generally Gundersen Prefiled Direct at 22-26.

⁶⁵ See Gundersen Prefiled Direct at 24.

,

1		
2		Mr. Barvenik's testimony fails to address why Entergy has not pursued removal of the
3		radiological contamination from the groundwater at Indian Point, and has instead chosen
4		a process that further contaminates the Hudson River. At other Entergy sites, extraction
5		wells are used to continuously remove the contaminating radiological hazard from the
6		surrounding groundwater in order to mitigate environmental damage and/or prevent the
7		harmful migration of radioactivity.
8		
9	Q.	Does Mr. Barvenik's testimony address any additional alternatives other than
10		Entergy's reliance upon a groundwater monitoring program?
11	А.	No it does not. As I stated above and in my prefiled direct testimony, Entergy has always
12		had the opportunity to remediate the contamination at Indian Point by installing
13		extraction wells, and yet Entergy has chosen not to do so.
14		
15	Q.	Based upon your review of Mr. Barvenik's testimony, please summarize your
16		opinion regarding Entergy's plans for detecting future radiological discharges from
17		Indian Point.
18	A.	Mr. Barvenik's direct testimony, as well as the documents I have examined in the
19		preparation of my direct testimony and this rebuttal testimony, show that Entergy only
20		plans to monitor for future leaks and has failed to design or effectively implement any
21		preventative methodologies or mitigation and remediation techniques in the event of a
22		new leak or to deal with its current ongoing leaks. The approach as outlined and
23		proposed by Mr. Barvenik will almost certainly result in current and future radioactive
24		leaks at Indian Point, continued groundwater contamination at persistently high levels,
25		and ongoing discharges of radionuclides into the Hudson River.
26		
27	<u>CON</u>	CLUSIONS
28	Q.	Please describe your conclusions related to the Mr. Barvenik's direct testimony.
29	A.	Mr. Barvenik's testimony leads me to draw the following conclusions:
30		(1) Leaks at Indian Point are varied and ongoing, and there will likely be future
31		radiological leaks from Entergy's Indian Point nuclear power plant.

DEC # 3-5522-00011/00004; SPDES # NY-0004472 DEC # 3-5522-00011/00030; DEC # 3-5522-00011/00031

1		(2) Leakage will continue to cause extensive plumes of contamination that will likely
2		persist at high levels and continue to enter the Hudson River.
3		(3) Remediation is possible at Indian Point but Entergy has failed to consider its use at
4		the plant. Instead, radiological contamination at Indian Point will remain in the
5		groundwater and "flush" to the Hudson River for decades.
6		(4) Entergy does not have adequate remediation and mitigation measures in place to
7		preventively detect future leaks and avoid ongoing violations of state water quality
8		standards.
9		
10	Q.	Does this conclude your rebuttal testimony?

11 A. Yes.

Supplemental Exhibit List/Bibliography

- Exhibit AG-Rad-33: Excerpt of NRC's Safety Evaluation Report Related to the License Renewal of Indian Point Nuclear Generating Unit Nos. 2 and 3 (NUREG-1930), November 2009 (Full report available at <u>http://www.nrc.gov/readingrm/doc-collections/nuregs/staff/sr1930/initial/index.html</u>, last visited Oct. 4, 2011)
- Exhibit AG-Rad-34: IPEC Site Management Manual, IP-SMM, CY-110, Rev. 3, 8.6 RGWMP Quarterly Integrated Review Checklist (Quarter 4, 2010); IPEC Site Management Manual, IP-SMM, CY-110, Rev. 4, 10.7 RGWMP Quarterly Integrated Review Checklist (Quarter 1, 2011)
- Exhibit AG-Rad-35: Excerpt of NRC's Safety Evaluation Report Related to the License Renewal of Indian Point Nuclear Generating Unit Nos. 2 and 3 (NUREG-1930, Supplement 1), August 2011 (Full report available at <u>http://pbadupws.nrc.gov/docs/ML1124/ML11242A215.pdf</u>, last accessed Oct. 4, 2011)
- Exhibit AG-Rad-36: Entergy Groundwater Monitoring Well Data, Quarter 2, 2011
- Exhibit AG-Rad-37: Excerpt of Entergy Nuclear Operations, Inc., Indian Point Unit 1, 2 and 3 Nuclear Power Plants, Docket Nos. 50-03, 50-247, and 50-286, Radioactive Effluent Release Report: 2010 (Full report available via NRC's Agencywide Document Access and Management System (ADAMS), Accession No. ML11172A042)
- Exhibit AG-Rad-38: E-mail from Dara Gray (Entergy) to James Noggle (NRC), with attached table entitled "Historic Strontium Tritium Results" (January 24, 2007)
- Exhibit AG-Rad-39: E-mail from John McCann (Entergy) to Arnie Gundersen (Fairewinds), Re: Thank You (April 1, 2010)
